

Link to video which shows how code works: <https://www.youtube.com/watch?v=AXFxWz6mHZU>

What happen there:

1. The first free bank number was taken from FREENUM vsam file:

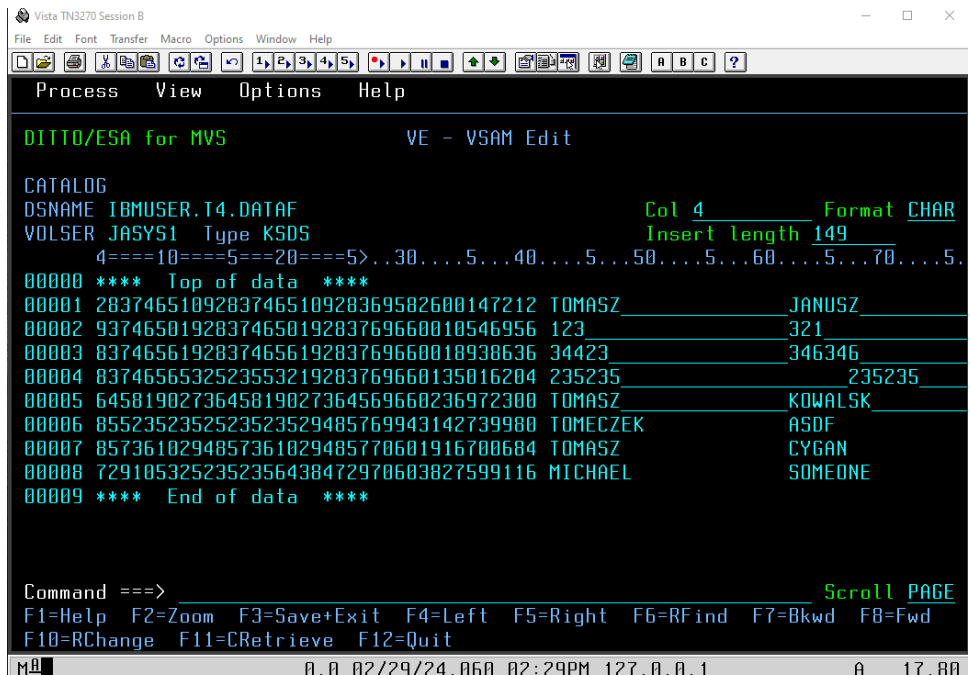

```

```

2. Later while trying to log into system program checked if in PASSF file there is some info about user, it failed so program checked if bank number is correct (in DATAF file), that data was correct so password was saved in PASSF file

[illegible]

3. Later opinion was saved to OPIF file

Program checkd also if bank exists.

In the file stays info about user rate, user bank account and his opinion, only if he put something there if not 'NONE' is saved
